

Why not use ChatGPT (or another similar chatbot)?

This subsection will refer to using ChatGPT (or another similar chatbot) just in the context of generating personalized content.

We have already provided the answer. ChatGPT is not *personalized* to your writing style and voice. Instead, it is very generic, unarticulated, and wordy. Maintaining an original voice is critical for long-term success when building your brand. Thus, directly using ChatGPT or Gemini will not yield the most optimal results. Even if you are OK with sharing impersonalized content, mindlessly using ChatGPT can result in the following:

- **Misinformation due to hallucination:** Manually checking the results for hallucinations or using third-party tools to evaluate your results is a tedious and unproductive experience.
- **Tedious manual prompting:** You must manually craft your prompts and inject external information, which is a tiresome experience. Also, the generated answers will be hard to replicate between multiple sessions as you don't have complete control over your prompts and injected data. You can solve part of this problem using an API and a tool such as LangChain, but you need programming experience to do so.

From our experience, if you want high-quality content that provides real value, you will spend more time debugging the generated text than writing it yourself.

The key of the LLM Twin stands in the following:

- What data we collect
- How we preprocess the data
- How we feed the data into the LLM
- How we chain multiple prompts for the desired results
- How we evaluate the generated content

The LLM itself is important, but we want to highlight that using ChatGPT's web interface is exceptionally tedious in managing and injecting various data sources or evaluating the outputs. The solution is to build an LLM system that encapsulates and automates all the following steps (manually replicating them each time is not a long-term and feasible solution):

- Data collection
- Data preprocessing
